Homework 2

Question 1. Add styles to the website you made in the last assignment using Cascading Style Sheets (CSS).

Starting with the following style in your `style.css`.

```
* {
  margin: 0;
  padding: 0;
  box-sizing: border-box;
  /* border: 1px solid rgb(var(--LN)); */
}
```

1.1. Requirements

These *are not mere suggestions*. If you don't fulfil the list bellow, you will possibly lose all the points.

1) You directory structure, directory names and filenames *must* match the following,

```
hw2
├── css
│   └── style.css
├── index.html
└── pages
    ├── about.html
    └── blog.html
```

2) The width of the body tag `<body>` should be no more than eighty characters `80ch`.
3) Pick three disctinct colours for background (`background-color`), foreground (`color`) and links. You can look up CSS Colour pallets.
4) If you wrapped the header text of your home, blog and about pages in the last assignment with the heading tags then remove them. Use CSS to make the header text three times larger than the normal text size.
5) Your header should have a faded version of the foreground colour as the background colour.
6) Your navigation menu should now appear on the same line with equal space between the menu options. When the reader hovers over the navigation menu links, they should change state, i. e., be highlighted.
7) There should be a little extra space after the unordered list in the navigation menu.
8) The level one, two and three heading tags should have some space before and after.
9) Add another entry in your blog. This time, it should be a piece of visual art, e. g., a painting, a sketch etc. Your image should have a caption and alternative text. Use the following HTML idiom for the entire blog entry,

```html
<h2>...</h2>
<figure>
  <img alt="..." width="250px" src="...">
  <figcaption><em>...</em></figcaption>
</figure>
<p>...</p>
```

Replace ellipsis with the appropriate information. Your image and caption should be horizontally centred. The paragraph tag after the image should contain your opinion on the image. This can be why you like it etc.

1.2. Examples

See figure 1 for examples.

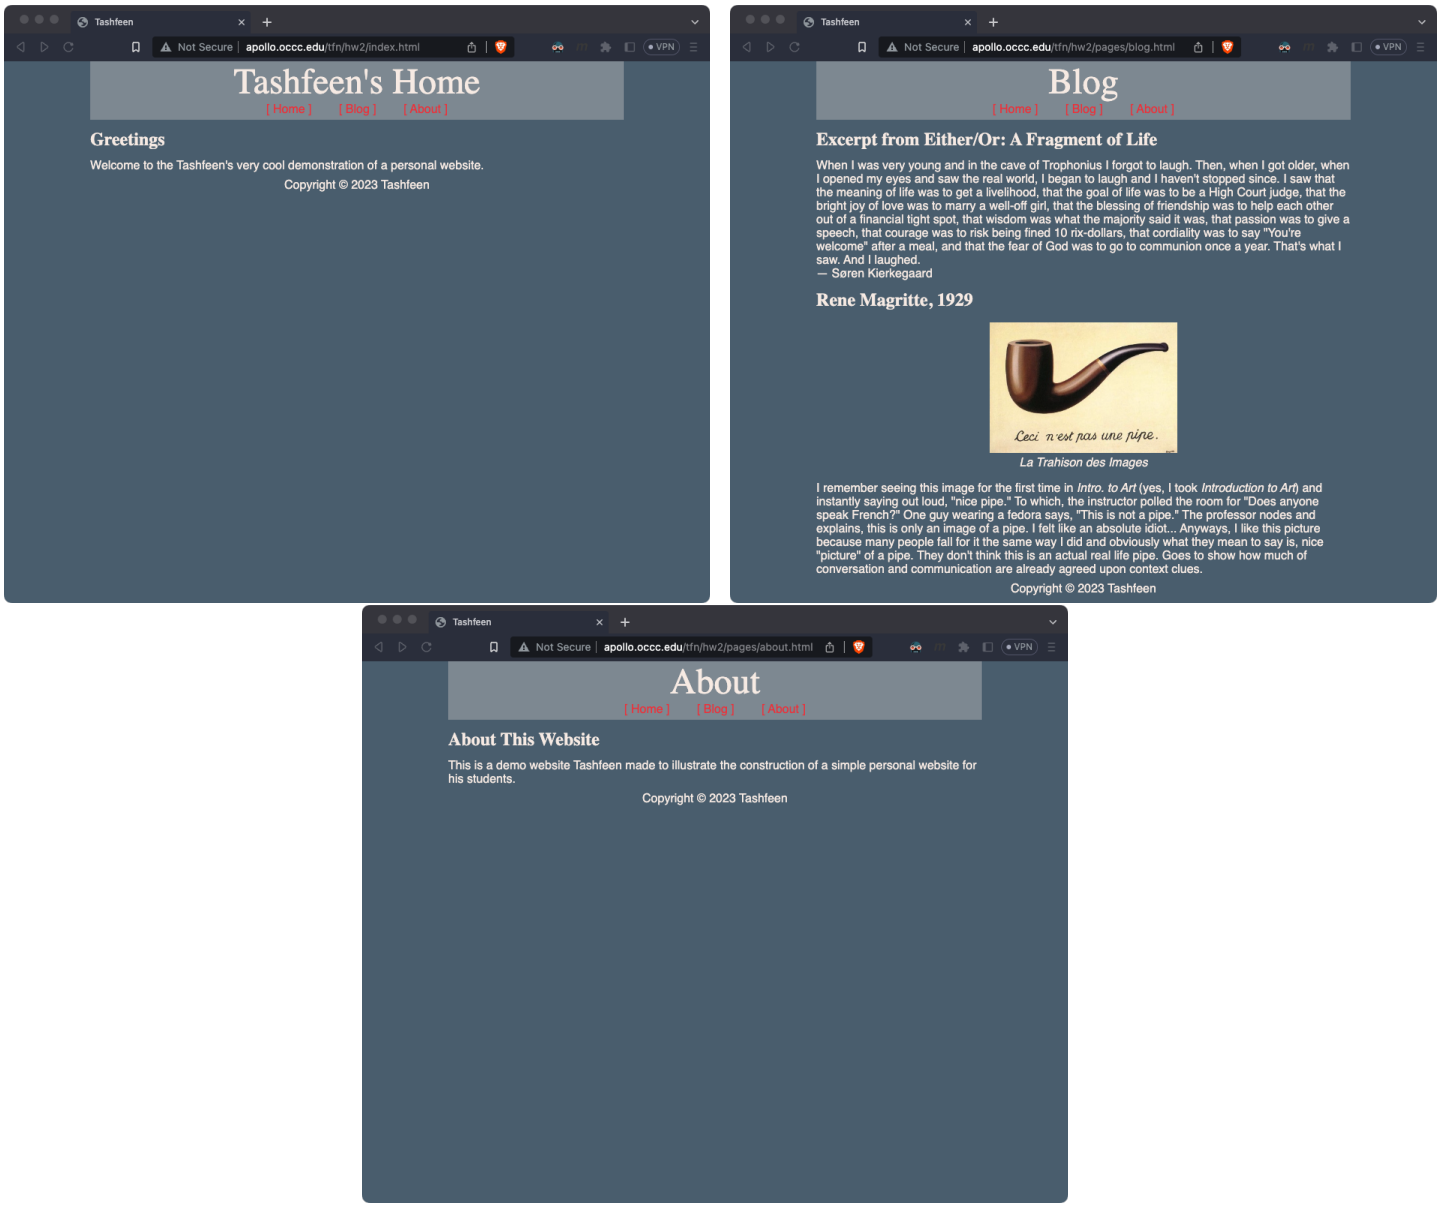

Figure 1. Example pages.

1.3. Submission Instructions

Push your website to Github Pages and submit a URL of the form `https://username.github.io/hw2` and `https://github.com/username/hw2`. Substitute your username for `username`.
